Experience

Eastern Edge Robotics **Oct 2021 – Jun 2026**

Chief Operating Officer (2023-2026) Software Lead (2022-2023) (Extra Curricular)

- Led a 35-member cross-functional team (software, electrical, mechanical) to a 1st-place finish at the 2026 MATE EXPLORER World Championship, owning prioritization and trade-off decisions under a fixed budget and deadline.
- Decided each season which capabilities to build, defer, or cut by weighing technical effort, risk, and competition value, translating broad goals into a buildable scope.
- Served as the translation layer between technical builders and non-technical stakeholders (sponsors, judges, university administration), converting ambiguous requests into clear direction.
- Architected the ROV control system in Python and ROS2, staying close enough to the build to assess feasibility with engineers.

Nasdaq Verafin **May 2024 – Aug 2024, Jan 2025 – Apr 2025**

Software Developer Intern

- Worked directly with users to diagnose reported problems, separating the surface request from the underlying need and routing fixes into engineering.
- Optimized database import parameters to improve data-transmission performance within the Verafin platform.

Angler Solutions **Sep 2023 – Dec 2023**

Co-op Engineering Student

- Led a team of three under Agile practices to deliver a Python wind-farm analytics application, aligning the build against a defined success criterion (optimal turbine placement).
- Coordinated network deployments across ten partner companies, aligning technical delivery with each company's requirements.

Bell Canada Enterprises **Jan 2023 – Apr 2023**

System Analyst

- Identified a high-effort manual workflow and delivered a Python automation that cut processing effort by 99.7%.
- Established a repeatable automation process for future co-op students, standardizing design and format across the team.

Avalon Controls **May 2022 – Aug 2022**

Engineering Co-op Intern

- Architected a communications and networking system that increased throughput 100x, weighing the trade-off against long-term maintainability.
- Produced a deployment plan for future expansion, defining how the system would scale beyond the initial build.

Education

Memorial University of Newfoundland **St. John's, NL, Canada**

Master of Business Administration Expected 2028

Bachelor of Engineering - Computer Engineering Class of 2026

Engineering Society Director of Communications (2023-2025), Relay for Life Tech Committee Lead (2022-2026)

Skills

Product & Leadership: Cross-functional team leadership, stakeholder communication, roadmap prioritization
Process & Analysis: Requirements gathering, trade-off analysis, success-criteria definition, Agile
Technical Depth: Python, JavaScript/TypeScript, ReactJS, NodeJS, ROS2
Platforms & Tools: Docker, AWS, Git, GitHub Actions, Grafana, Proxmox VE
Embedded & Hardware: Raspberry Pi, ESP32, Arduino, integrated hardware/software systems

Projects

Corbett Homelab

- Cut home electricity consumption 30% by automating lighting and heating control.
- Scoped and self-hosted a service suite on a Proxmox and Docker environment.
- Integrated 500+ smart home devices across IoT, Zigbee, Z-Wave, and Bluetooth.
- Prioritized which services to run by weighing maintenance cost against value.
